

TAX AGENT

Problem statement & motivation

What real-world business problem are you addressing?

A. Gibbs & Associates is an accounting and tax firm that handles sensitive financial data, client communications, and document-heavy workflows. Many of their core processes such as collecting client tax documents, organizing files, answering repetitive client questions, and preparing tax returns are time-consuming and manual. This leads to high administrative workload, repetitive communication tasks, risk of human error, slower turnaround times, and limited marketing automation. This project aims to streamline operations, reduce manual effort, improve client experience, and modernize the firm using AI-driven automation.

Who are the target users?

1. Internal Users: Tax preparers,
2. External Users: Individual tax clients and small business clients.

Why is an agentic AI solution appropriate here?

The work being done at the firm includes a lot of repetitive, step-by-step tasks that follow clear rules, like sorting documents, answering common questions, and sending reminders. Because of this, an AI system can handle multiple steps on its own — for example, taking a file upload, organizing it correctly, and letting staff know it's ready. The system can run all the time, which is especially helpful during the busy tax season when workload increases. It also allows clients to get quick responses online while still supporting, not replacing, the staff at the firm.

Use cases & scenarios

Scenario 1: A client uploads tax documents

Tasks the agent performs: Accept file upload, recognize document type, categorize files, label them, Prepare tax return, notify tax preparer, and log activity.

Scenario 2: A client asks a tax-related question

Tasks the agent performs: Interpret question, determine complexity, answer basic questions, provide filing steps, share checklist, record interaction, send follow-up email.

Scenario 3: Client engagement & reminders

Tasks the agent performs: Track deadlines, send email reminders, send birthday/promotional emails, suggest marketing content, and segment clients.

Initial system design

Preliminary list of agents and roles

Document Processing Agent – Identifies and categorizes uploaded documents.

Tax Preparer Agent – Uses documents to fill out tax returns

Tax Assistant Agent – Answers tax questions and provides guidance.

Workflow Agent – Connects processes and automates task flows.

Communication/Marketing Agent – Sends reminders, promotions, and engagement emails.

Escalation Agent – Routes complex issues to staff.

Security/Compliance Monitor – Ensures safe data handling.

Expected tools/APIs or data sources

Website upload system, email platform APIs, tax software, cloud storage, internal database, AI/LLM APIs, CRM integration.

Feasibility & risks/Potential challenges

AI hallucination, security, document misclassification, integration issues, over-reliance on AI.

Constraints

Security risks, privacy regulations, secure authentication, and website integration requirements.

Timeline for project execution

Weeks 1–2 Requirements gathering

Weeks 3–4 System design

Weeks 5–7 Document agent prototype

Weeks 8–9 Q&A agent

Weeks 10–11 Email automation agent

Weeks 12–13 Testing and security review

Weeks 14–15 Final demo & documentation
