

Risks	Mitigation Plan	
	Design & development of agent	Agent integration into processes
Adversarial attacks	Validate and sanitize all text and image inputs; enforce strict JSON schemas; ensure the Verifying Agent rejects malformed or manipulated data.	Apply rate-limits, block suspicious requests, and log anomalies to detect repeated probing or injection attempts.
Bias and discrimination	Focus agents strictly on product attributes; use consistent scoring formulas; avoid subjective or brand-prestige-based judgments.	Audit outputs for biased patterns and refine prompts; make scoring criteria transparent to users.
Misinformation and hallucinations	Require search-grounded analysis; enforce structured outputs; have the Verifying Agent cross-check claims and remove unverifiable items.	Add a final validation layer before rendering; include disclaimers; monitor user feedback to correct recurring issues.
Data privacy violations	Process images and descriptions in-memory only; strip metadata; avoid storing user data in prompts.	Use secure transmission; delete temporary data after each session; provide clear privacy notices.
Intellectual property risks	Ensure agents summarize rather than copy retailer text; avoid reproducing proprietary descriptions.	Display only factual product attributes; use generic retailer references when needed; follow fair-use principles.
