

Project Proposal

Our Opal AI agent is given a copy of the Chick-fil-A employee handbook. A user can ask a question about the handbook and the agent will return with an answer. Our goal is to provide a helpful and accessible resource to restaurant workers who may be in a rush or emergency, unable to spend a long time searching through rules and information. Our target audience for this agent is store/restaurant workers, or any other position that may require a handbook and specific rules to follow. An agentic AI solution is absolutely necessary here because an AI agent is capable of searching, locating, analyzing, and providing feedback from multiple pages of documents faster than a human would take to do it themselves.

Use Case Scenario 1: A user is running late to his shift at Chick-Fil-A. He forgets whether or not jewelry is allowed for employees, and needs to figure out whether or not he should take his earrings out before he leaves. The user can ask the Opal agent, “Can I wear piercings to work?”. Here is the exact response that the agent returns:

According to the Chick-fil-A Bonsack Team Member Policy Handbook (page 8), the policy regarding piercings is as follows:

Gender and Location: Piercings are limited to employees identifying as female and are permitted in the ears only.

Prohibited Locations: Piercings are not allowed in the nostrils, eyebrows, lips, tongue, or any other visible locations.

The user can conclude that he is not allowed to wear any piercings at all, because he is not a female.

Use Case Scenario 2: A user is an employee that is very hungry during her shift. Even though she knows she's not supposed to eat food during she shift, she considers facing the consequences. She is curious to know if the punishment for eating is worth taking the risk, but does not have a lot of time to read and search in the handbook herself in the middle of taking and delivering orders. The user can ask the AI agent, "What is the punishment for eating during my shift?". Here is the response the Opal AI agent gives:

Immediate Dismissal: Food theft is listed as one of the most common examples for severe disciplinary action, which may result in immediate termination of employment without prior progressive discipline (pages 14–15).

The user learns that eating during her shift can result in losing her job, and decides against it.

The Opal agent has the "Answer Question" function at the center. This function takes the user's input/question and searches the source for an answer. The agent includes the "Find in Source" function, and a separate function that just contains the source, a Google Docs PDF document containing the CFA handbook. These two functions are connected to Answer Question from the left side. To the right of Answer Question, it connects to a function called "Render". This function takes information from the other function and outputs an answer to the user. Data tools and sources expected to be used for this project are Opal AI and Google Drive, and web search to obtain a public handbook source. The main risk is time constraints for the agent. The agent can take more than expected time, for example 60 seconds or more, to output a single response. This can be affected by internet connection. A potential challenge we may run into is getting the agent to give a concise answer. Even a short and simple question can result in 1-2 paragraphs or multiple bullet points in the output. The user might be expecting a much shorter

answer and can feel overwhelmed with a long one. The time limit for this project is 3 months, however this may be subject to change.
